Contributions to dating the Late Bronze Age pottery in North-Western Romania

Orsolya Gyurka

Abstract: In the 16th century BC significant social and economic transformations took place in North-Western Romania, reflected in the abandonment of the Middle Bronze Age tell settlements and the emergence of the Tumulus material culture. In the area between the Crasna, Crişul-Repede rivers, the Meseş Mountains, and in a large part of the Berettyó/Barcău-Körös/Criş region and the Upper Tisza valley in Hungary, the ceramic style, which developed as a mixture of the local Middle Bronze Age and the Tumulus pottery stylistic elements, is known in the literature as the Hajdúbagos/Pişcolt-Cehăluţ, Cehăluţ-Hajdúbagos, or Hajdúbagos/Cehăluţ cultural group. The present paper contributes to the research of the Late Bronze Age with ¹⁴C data from Tăşnad-Sere and attempts to systematise the Hajdúbagos-Cehăluţ through pottery assemblages by a combined analysis of the available ¹⁴C dates from Tăşnad-Sere and Recea-Valea Sulduba sites and the associated ceramic finds.

Keywords: Late Bronze Age; Tumulus culture; Hajdúbagos–Cehăluţ pottery; absolute dating.

Introduction

From the 16th century BC, a turning point can be observed throughout Eurasia, which, in addition to environmental and climatic changes on the continent¹, can also be interpreted as a response to increased population² and mobility. This period is marked by the gradual abandonment of the tell settlements³ and the migration of the Tumulus communities from Southern Germany to Central Europe,⁴ which reached the Great Hungarian Plain and north-western Romania at the end of the Middle Bronze Age (MBA), in the Koszider period (1600–1500/1450 BC)⁵. It is at this time that new elements appear in the local material culture, a phenomenon which is the result of a specific mixture of the local MBA and the newly arrived Tumulus communities' pottery traditions. The changes observed in the material culture mark a process of hybridisation⁶. As a result, the Hajdúbagos–Cehăluţ style⁷

⁶ Cultural hybridisation is the result of intensive interactions and is reflected in the intense mixing of elements of the artefactual material. (Stockhammer 2012, 45–51) The concept of hybridisation refers to the interaction of different cultures, resulting in the emergence of a new material culture. The process is characterised by cultural sharing or correspondence, exchange, modification and cultural experimentation. (Stockhammer 2012, 44–45) Hybridisation takes place in contact areas where communities with different material cultures have the opportunity to interact and influence each other. Hybridisation manifests itself through different modes of import, imitation or cultural communication. From an archaeological point of view, it is possible to study foreign elements on objects as a result of external influence. (Stockhammer 2012, 50)

⁷ The definition of the cultural facies of the first two periods of the Late Bronze Age (LBA I-II) in North-Western Romania can be attributed to T. Bader, J. Németi and C. Kacsó, while in the Körös-Berettyó region and the Upper Tisza region in Hungary it is associated with T. Kemenczei and T. Kovács. Following the Koszider period at the end of the Middle Bronze Age, in the early Late Bronze Age (BzB1/BzB2–BzC), T. Kemenczei and T. Kovács has defined the Hajdúbagos group in Hungary, formed as a result of the mixture between the local Otomani culture and the newly arrived Tumulus groups at the beginning of the LBA (BzB2–BC) in the Berettyó–Körös region (Kemenczei 1963, 184–185; Kemenczei 1968, 165; Kemenczei 1984, 96; Kovács 1966; Kovács 1970, 27–45). At the same time, in the area bounded by the Crasna, the Barcău rivers and the Meseş Mountains in north-western Romania the material culture was identified first as Otomani IV (Bader 1978, 62; Bader 1998, 53), then as Pişcolt-Cehăluţ (Németi 1987, 110; Németi 1990; Németi 1999; Németi 2009) and as Cehăluţ (Kacsó 1990, 44; Kacsó 1997; Kacsó 1999) cultural group, which can be traced until the BzD period. More than 30 years later, M. L. Nagy attributes the sites of the Berkesz culture in the southern and western parts of the Nyírség to the Hajdúbagos group, noting that other eastern populations probably also contributed to the development of this later phase of the ceramic material.

has been distinguished in the Barcău/Berettyó–Criş/Körös region and the northern parts of the Great Hungarian Plain, in the area bounded by the Crasna, the Criş valleys and the Meseş Mountains, during the first two phases of the Late Bronze Age (LBA I-II)⁸. Following the Wietenberg IIIrd phase, the ceramic material attributed to the Hajdúbagos–Cehăluţ style is encountered in Transylvanian areas east to the Meseş Mountains, too, which can be the result of the migration of some communities from north-western Transylvania, although it is also possible, that only a large number of pottery is brought into the region⁹.

Regarding the inner chronology, as a working hypothesis, C. Kacsó divides the Cehăluţ group into two phases: the first phase can be paralleled with the Hajdúbagos group, while the second with the Berkesz culture. This is also reflected in the metallurgy. The second phase of this group includes the settlements in the valleys of Crasna and Barcău Rivers¹⁰. In his view, the group develops during LBA I–II¹¹. Its early phase is parallel to the middle phase of the Tumulus culture and its end to the late phase of the Urnfield culture¹². On the Cehăluţ-type pottery, he notes that, in addition to the Otomani stylistic features, they bear formal and ornamental elements of Suciu de Sus, Tumulus and Piliny styles¹³.

I. Bejinariu also distinguishes two phases in his monograph on the Hajdúbagos–Cehăluţ pottery style in the řimle Depression, based on the pottery's stylistic elements¹⁴.

M. Przybyła has undertaken a macro-regional analysis of the Tumulus contact network on several occasions, including the Hajdúbagos–Cehăluţ sites. The researcher traces the spread of stylistic elements of the pottery in the Carpathian Basin and southern Poland, thus revising the results of traditional archaeological research from a new perspective and with a completely new methodology. He classifies the older phase of the Piliny culture, the Berkesz–Demecser group, the Suciu de Sus sites in Slovakia, the Egyek group, the Hajdúbagos and Cehăluţ groups, the first phase of Lăpuş I, the Rákóczifalva group, the early Igriţa phase, the Păuliş group, the Bădeni–Deva III group and the Buza–Teiuş horizon into the

On the basis of the similarities observed in the pottery, she considers the name Hajdúbagos/Cehăluţ to be justified, as they appeared in the Koszider period and then both developed until the BzD period. (Nagy 2007, 27; Nagy 2008, 137–142) I. Bejinariu emphasizes the influence of the Wietenberg style on the formation of the Hajdúbagos–Cehăluţ pottery style, as a high number of Wietenberg ceramic assemblages can be found in former Otomani sites (Bejinariu 2022, 121–122).

⁸ Németi 2009, 212.

⁹ Bejinariu 2022, 94.

¹⁰ Kacsó 1990, 44; Kacsó 1997.

¹¹ According to the relative chronology, the LBA I can be dated to BzB2–BzC1 phase (1600/1500–1350 BC), while LBA II is dated in Bz C2–Bz D/Ha A1 period, between 1350–1200/1150 (Kacsó 1990, 42–50; Przybyła 2009, 62–63; Gogáltan 2019, 49). On the basis of the radiocarbon data, the LBA I covers a time span between 1600 and 1400 BC. (Gogáltan 2019, 49). A specific chronological system was developed for the Lower Mureş Basin, where the phases of the LBA corresponds to historical events, dated with ¹⁴C data. The LBA I can be placed in the interval of 1550–1450 BC when the abandonment of the tell-settlements and the beginning of the construction of the mega-forts took place. The next period, the LBA II (1450–1250 BC) is characterised by the development of these great fortifications (Sava 2020, 289–290; Sava–Ursuţu 2021, 85).

¹² Kacsó 1990a, 8–50; Kacsó 1997, 85–88; Kacsó 1999, 101; Kacsó 2005, 53.

¹³ For a short synthesis of the Late Bronze Age ceramic styles see Przybyła 2009 and Sava 2020, 256–259, with new radiocarbon data.

¹⁴ According to I. Bejinariu, the first phase is characterised by the use of biconical amphorae with a rounded belly and two handles connecting the neck to the shoulder, and by the use of S-shaped dishes with conical or curved body and everted or lobed rim. The most common form of bowls in the řimle Depression is the so-called Swedish helmet type (Bejinariu 2022, 47). Also very frequent are the cups with ringed base and semi-spherical lids with channelled rim. Early ornamental motifs include arches filled with incisions, groups of 2–4 vertical lines, as well as groups of lines arranged in the form of arches and spirals. In this period, conical knobs surrounded by semicircular channellings are usual. The wide absatzstich technique used during late Wietenberg III and IV periods, which also appears in the Hajdúbagos–Cehăluţ assemblages, is particularly characteristic for the region. In the second phase of the pottery style, biconical amphorae with a strongly broken belly line, conical neck and a wide, horizontally everted rim are found in large quantities. (Bejinariu 2022, 103) Also, a typical vessel form is the short cup with a handle raised over the rim, and the spherical or flattened spherical mug, with high neck, straight or ringed-based mug, ornamented with groups of three incisions. The decoration shows a smaller proportion of elements of the earlier phase: hatched arcades, conical knobs, knobs surrounded with semicircular channelling and groups of incised lines. There is a high proportion of bowls with inverted rim, often with small knobs under the rim, and biconical cups with narrow mouth. Bowls with lobed rim remain in use, but the rims are disproportionately high and the inner surface of the bowls is sometimes decorated with star-shape ornament. The second phase is also characterised by the increasing frequency of channelling on the surface of the vessels, typically associated with vertical ribs or conical knobs. Faceting is another newly used and important decorative technique. (Bejinariu 2022, 107)

Tumulus–Post-Otoman style¹⁵. Przybyla considers the amphorae with wide, round belly, cylindrical or conical neck, the dishes with lobed rim, the biconical mugs and the hatched arches as being the authentical elements of the pottery assemblages of the period¹⁶. In a study published in 2016, he reevaluates his research using modern methodology. The 94 Middle and Late BA sites he analyses, cover the period from the 19th to the 12th century BC. Among them are the Hajdúbagos–Cehăluț sites of Acâș–Râtul lui Veres, Crasna–Csereoldal, Pișcolt–Nisipărie and Nyíregyháza–Oros–Úr csere. The analysis shows that the presence of pottery classified as belonging to tell societies and the one characteristic for the Tumulus communities is at least partially contemporaneous in the Carpathian Basin¹⁷.

Other concerns related to the systematic analysis of the ceramic assemblages of the LBA I–II are limited to the elaboration of typologies for single sites¹⁸ or smaller regions¹⁹.

The dated sites

Only 2 published ¹⁴C dates from Hajdúbagos–Cehăluț sites are available so far²⁰ from Recea–Valea Sulduba/CEMACON²¹, three additional analyses were performed on samples from Tășnad–Sere.

The archaeological site of Recea–Valea Sulduba/CEMACON is located in north–western Romania, in the Crasna Valley, in the area of Șimleu Depression. Excavations were undertaken in 2008, during which 8 constructions and several pits were unearthed, belonging to the LBA I–II. The constructions were arranged on two parallel rows, the settlement covering an area of 0,35 ha²².

Tășnad–Sere archaeological site²³, discovered in 1987, is located in Satu Mare county, on the south-western periphery of Tășnad city. It is placed in a low area, on the first two terraces of the Cehal stream, a tributary of the Ier river. It was mainly the Neolithic settlement excavated here, that brought it to the forefront of the research²⁴. Since 2001, due to the expansion and modernisation of the thermal baths, preventive archaeological excavations have been carried out several years by the Satu Mare County Museum and the City Museum of Carei. During the excavations, settlement features from several periods have been found, dating to the Neolithic (Starčevo–Criș, Pișcolt), the Copper Age (Tiszapolgár, Coțofeni), the Late Bronze Age (Hajdúbagos–Cehăluț), the La Tène period, the Roman Age (3rd–4th centuries AD) and the 6th–7th centuries²⁵. Preventive excavations in 2006 revealed a Late Bronze Age settlement on the right side of the Tășnad–Marghita county road²⁶. Major excavations were carried out at the site in 2009, prior to the expansion of the Tășnad Thermal Complex, with the opening of several trenches. Archaeological researches continued in 2015²⁷, along the route of the road bypassing the town. The road crosses the terrace of the Cehal stream, the archaeological features are concentrated on a higher territory, near the dead bed of the stream. Smaller surfaces were researched in 2019²⁸, covering the territory between the excavations undertaken in 2009 and 2015. In total 81 features can be dated in the LBA I and II periods.

AMS radiocarbon analyses on samples from three Late Bronze Age pits excavated in 2009 at Tășnad–Sere²⁹ site was carried out by Isotoptech Zrt. The samples selected from the settlement of

¹⁵ Przybyla 2009, 120. Similarly, Gábor V. Szabó considers the Hajdúbagos–Cehăluț group to be part of a larger unit, placing it in the pre-Gáva period. (V. Szabó 2017, 239)

²⁹ The poorly preserved bone material and the lack of other organic materials limited the possibilities for radiocarbon analyses. In addition to the presented samples, bone material from later excavations was also analysed, but the quality of the material was not sufficient.

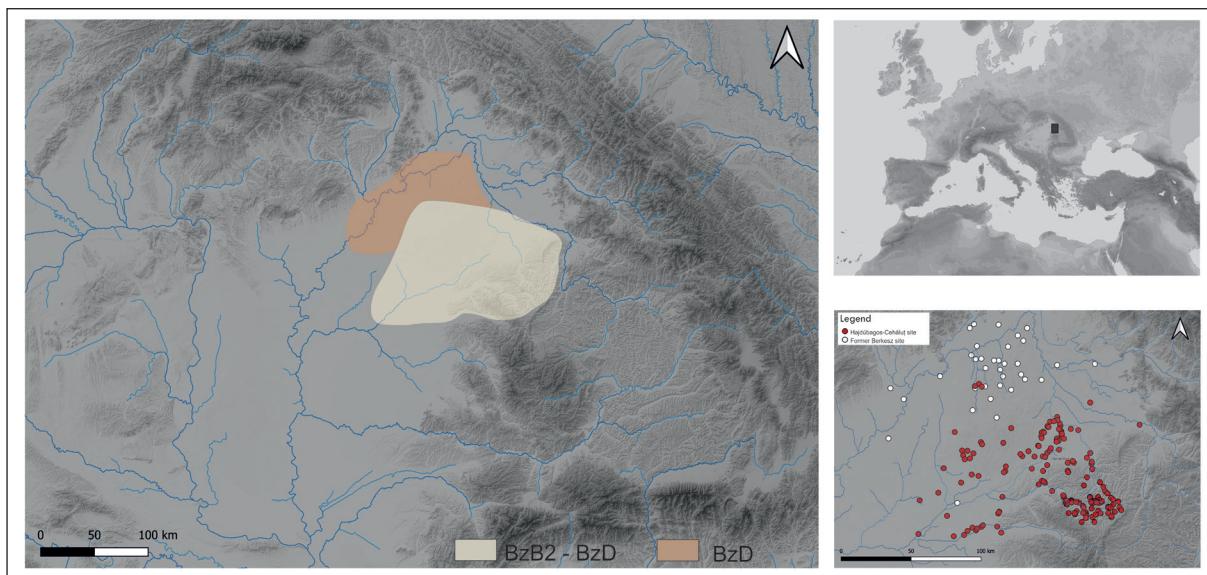

Fig. 1. The distribution area of the Cehăluț-Hajdúbagos ceramic style (based on Kemenczei 1984; Németi 2009; Bejinariu 2022). Red dots: Hajdúbagos–Cehăluț sites, white dots: former Berkesz sites.

Tășnad are DeA-13486: charcoal from feature Cx185, DeA-24132: animal bone from feature Cx225 and DeA-24133: animal bone from feature Cx195. The results of the samples allow us to distinguish an earlier and a later phase of the settlement. The early phase includes pit Cx225 (DeA-24132), which has a calendar age of 1620–1460 (calBC, $\pm 2\sigma$). Slightly younger is pit Cx195 (DeA-24133), with a calendar age of 1510–1420 (calBC, $\pm 2\sigma$). AMS measurement of feature Cx185 (DeA-13487) show an interval between 1373–1357 BC and 1299–1125 BC (calBC, $\pm 2\sigma$).

The settlement of Tășnad is contemporary with Recea–Valea Sulduba. Here, too, an early and a late phase of the settlement can be observed, based on the absolute dates. Measurements on sample from feature Cx68 (DeA-25953) show an interval of 1530–1420 BC (calBC, $\pm 2\sigma$), while the sample from feature Cx13 (DeA-25952) places the pit between 1410 and 1210 BC (calBC, $\pm 2\sigma$)³⁰.

On the basis of the calibrated data, in the LBA I can be included feature Cx225 (1564–1492 cal BC) from Tășnad. This is contemporaneous with the sites from Geoagiu de Sus³¹, Gligorești³², Ménfőcsanak³³, Șagu³⁴ and Vlaha–Pad³⁵. A similar time interval is shown by dates from the early layers of Teiuș–Valea Viilor³⁶ Noua settlement and Sântana–Cetatea Veche³⁷. The data from feature Cx195 (1502–1422 cal BC) from Tășnad and from feature Cx68 (1518–1423 calBC) from Recea also starts in the transitional period between the Middle and Late Bronze Age. According to the absolute dates, feature Cx185 (1301–1124 calBC) from Tășnad and feature Cx13 (1409–1219 cal BC) from Recea represents a later phase of the Hajdúbagos–Cehăluț assemblages, coexisting with Sântana–Cetatea veche (MAMS 33948, MAMS 33945, MAMS 37712)³⁸, the late phase of the cemetery from Pecica (RoAms 988. 80)³⁹, the Noua layers from Rotbav (Hd-27972)⁴⁰ and the settlements from Teiuș (OS-113542)⁴¹, Alba Iulia (Hd-29183)⁴² and Borumlac (OS-108807)⁴³. In addition, samples from Geoagiu

Fig. 3. The AMS calibrated dates from Tăşnad and Recea.

de Sus (OS-100528)⁴⁴ and Polgár (Deb 9674)⁴⁵ can be included in this period. The late Tumulus and early Urnfield site of Németbánya–Felsőerdei-dűlő existed also in this period⁴⁶. Further evidence of the simultaneousness of Noua and Hajdúbagos–Cehăluț pottery styles is provided by the traces of a Noua settlement found at Sutor in Sălaj County, on the eastern border of the Hajdúbagos–Cehăluț area, dating between 1420 and 1270 cal BC (DeA-41173)⁴⁷.

In the LBA I, the Hajdúbagos–Cehăluț finds are contemporaneous with the Wietenberg IV period, the Cruceni–Belegiș I phase in the Banat region, and the Piliny and other Tumulus groups (Rákóczifalva⁴⁸, Tápé⁴⁹) from the Great Hungarian Plane. The Noua pottery style also appears at this time in the Carpathian Basin. This is followed by the LBA II period, characterised by the cooccurrence of the late Hajdúbagos–Cehăluț, Noua II, Cruceni–Belegiș II pottery in the Carpathian Basin, based on the ¹⁴C data⁵⁰.

The pottery assemblages

The radiocarbon dated ceramic assemblages from Tășnad, features Cx225, Cx 195 and Cx185, and Recea, pit Cx68 and Cx13 are diverse in both shapes and ornamentation, and thus can be associated with a significant number of elements of the Hajdúbagos–Cehăluț ceramic style.

Forms 1A, 3A1, 3A2, 3H2, 3H3, 3H4, 3D, 3E1, 3E2, 3F, 3G, 6A, as well as ornamental motifs A1, D1, F1, F2, H1, I1, I2, I3, I4, I5, L1, N1, N2 date to the time interval between 1564 and 1492 BC. (Fig. 4, Fig. 5)

⁴⁹ Trogmayer 1975. Due to the radiocarbon dates, it is now known that the cemetery was used between 1500 and 1200 BC. (O'Shea et al. 2019, Fig. 5, Tab. 3; Sava 2020, Fig. 12)

⁵⁰ Gogâltan 2019, 51.

Type 3C2, 3C1, 3H1, 3L1, 3R1 of dishes and F3, H2, M1 ornamental motifs are present in the Hajdúbagos–Cehăluț find assemblages between 1518 and 1423 BC. In the same time interval (1502–1422 BC) M2 and I6 ornamental elements appear often on the pottery. In the period between 1409 and 1219 BC can be included vessel shapes 2A, 2B, 3A3, 3B and 5A, together with motifs C1, C2, H3, H4 and I7.

In the latest phase, between 1301–1124 BC the pottery shapes 1D1 and 2C, and ornamental elements A2, C3, F4, F5, H5 and I8 can be dated.

The 4A cup is found in all phases of the Hajdúbagos–Cehăluț style, between 1500 and 1200 BC (Fig. 4, Fig. 5).

Pottery shapes

Among the earliest pottery shapes can be included the small amphorae (1A) with everted rim, tall, cylindrical, neck, flattened spherical body and with two handles starting from the middle part of the neck and resting on the shoulders. In Hajdúbagos–Cehăluț environment it occurs only at Tăşnad–Sere in feature Cx225 (Pl. 1/1), but its predecessor is found in the pottery assemblages of the last period of the Füzesabony–Otomani Cultural Complex (OFCC)⁵¹.

Bowl 3A1, with wide mouth, flaring, lobed rim, short cylindrical or slightly conical neck, and conical body, is one of the few authentic forms of the Hajdúbagos–Cehăluț style. It has been found at Acâș–Râtul lui Veres⁵², Crasna–Csereoldal⁵³, Suplacu de Barcău–Lapiș⁵⁴, Șimleu Silvaniei–Observator⁵⁵ and Tăşnad–Sere (Pl. 5/1).

A similar bowl (3A2) with lobed, flaring rim, short, cylindrical neck and slightly arched body is met in Hajdúbagos–Cehăluț environment at Biharea–Grădina CAP–Insulă⁵⁶, Cehei–Misiig/Mesig⁵⁷ and Tăşnad–Sere (Pl. 4/7).

The 3H2 deep bowl with flaring rim, short cylindrical neck and arched shoulder is encountered at Crasna–Csereoldal⁵⁸, Sărăuad⁵⁹ and Tăşnad–Sere (Pl. 3/3) sites, but the shape is inherited from the MBA OFCC⁶⁰. It also occurs in Măhăceni–La biserică settlement⁶¹, where it is found together with Noua, Wietenberg and Hajdúbagos–Cehăluț finds. It can be met among the pottery assemblages assigned to Wietenberg⁶² and Suciu de sus⁶³ styles, too.

Also rooted in the MBA, bowl 3H3 with slightly flaring rim, wide mouth, slightly arched, short neck and accentuated shoulder is present in the assemblages from Acâș–Crasna veche⁶⁴, Crasna–Csereoldal⁶⁵, Carei–Bobald 2B⁶⁶ and Tăşnad–Sere (Pl. 4/5). Similar bowl shapes are used in Wietenberg environment at Bernadea⁶⁷, Corpadea⁶⁸ and Dersida–Dealul lui Balotă⁶⁹.

Bowl type 3H4 with flaring rim, arched neck and body is found at Tăşnad–Sere (Pl. 4/3–4), Biharea–Grădina CAP–Baraj⁷⁰, as well as at Acâș–Crasna veche⁷¹, Crasna–Csereoldal⁷², Körösszegapáti–Pál–lapály⁷³ site, and in Igrita⁷⁴ and Wietenberg⁷⁵ environment.

⁷⁵ Corvinești (Boroffka 1994, Taf. 65/1.)

The 3D deep bowl with slightly inverted rim, semi-spherical body and straight base is found in Hajdúbagos–Cehăluț environment at Tăşnad–Sere (Pl. 2/1–3, 3/1), Biharea–Grădina CAP–Insulă⁷⁶, Berveni–Râtul caprei⁷⁷, Carei–Ferma I.A.S.⁷⁸, Crasna–Csereoldal⁷⁹, Carei–Bobald 2B⁸⁰, Cehei–Misig⁸¹, Körösszegapáti–Pál-lapály⁸², Nyíregyháza–Oros–Úr csere⁸³ and Nyírlugos–Szennyespuszta/Szabadságtelep, Folyási dűlő⁸⁴. This shape is present in Wietenberg environment⁸⁵, also having analogies in OFCC⁸⁶ and Piliny⁸⁷ sites.

The semi-spherical bowl (3E1) with flaring, thickening rim occurs in Hajdúbagos–Cehăluț type settlements at Acâș–Crasna veche⁸⁸, Crasna–Csereoldal⁸⁹ and Tăşnad–Sere (Pl. 4/2). The shape is often encountered in the OFCC⁹⁰ and Suciu de Sus⁹¹ ware.

The 3E2 semi-spherical deep bowl with onward flaring rim and straight base is found only at Acâș–Râtul lui Veres⁹² and Tăşnad–Sere (Pl. 2/4), but it is also part of the Wietenberg communities’⁹³ material culture.

The conical bowl type (3F) with wide mouth and conical body, sometimes with two handles below the rim, is considered to be a common shape of the BA, as it is found in the pottery of the OFCC⁹⁴, Tumulus⁹⁵, Piliny⁹⁶, Suciu de Sus⁹⁷ and Wietenberg⁹⁸ communities, in addition to the Hajdúbagos–Cehăluț⁹⁹ assemblages.

A characteristic bowl type is 3G, with arched, inverted rim and conical body. It appears in the MBA¹⁰⁰. Later, in the Hajdúbagos–Cehăluț area it is encountered mostly in the Ier valley and Tăşnadului Plain at Acâș–Râtul lui Veres¹⁰¹, Berveni–Râtul caprei¹⁰², Carei–Bobald 2B¹⁰³ and Tăşnad–Sere (Pl. 8/2). The vessel shape appears in Tumulus territories located north-west to the Hajdúbagos–Cehăluț areas, in Salka I cemetery¹⁰⁴ and among Piliny¹⁰⁵ and Egyek¹⁰⁶ pottery assemblages. Analogies can also be met in Banat, in the Cruceni–Belegiș¹⁰⁷ ceramic material.

Jar 6A, with high, slightly conical neck, wide, flattened spherical body, flaring rim and with a handle slightly raised over the rim, also occurs in the MBA OFCC¹⁰⁸, later in the pottery assemblage of Tăşnad-Sere (Pl. 6/8–9), Doh-La izvoare¹⁰⁹ and in Igrita¹¹⁰ environment.

The bowl with everted, slightly thickened rim, short, curved neck, accentuated shoulder and a slightly arched body (3C2) was already in use in the MBA by the OFCC¹¹¹ and Wietenberg¹¹² communities. In the LBA I-II it can be encountered at Biharea¹¹³, Álmosd-Téglavető dűlő¹¹⁴, Körösszegapáti-Pál-lapály¹¹⁵, Nyíregyháza-Tesco, Shell fuel station¹¹⁶, Nyíregyháza-Oros-Úr csere¹¹⁷, Recea-Valea Sulduba/CEMACON¹¹⁸ and Tăşnad-Sere sites in Hajdúbagos-Cehăluț assemblages. It can be found in the Tumulus¹¹⁹ and Balta Sărătă¹²⁰ environment. Later it continues to be used during the Gáva period, as well¹²¹.

The bowl with wide mouth, slightly flaring, thickened rim and biconical body (3C1) is a common shape of the LBA, as it occurs at Crasna-Csereoldal¹²², Marca-Husäu¹²³, Recea-Valea Sulduba/CEMACON¹²⁴ and Tăşnad-Sere. The form is also found among the finds from Salka I cemetery¹²⁵.

The 3H1 bowl form has a flaring rim, pronounced, arched shoulder and conical body. It appears in the OFCC¹²⁶ and in the LBA becomes a frequently used vessel type. It can be found at Biharea¹²⁷, Acâș-Râtul lui Veres¹²⁸, Cehei-Misig¹²⁹, Crasna-Csereoldal¹³⁰, Doh-La izvoare¹³¹, Recea-Valea Sulduba/CEMACON¹³² and Marca-Husäu¹³³.

The form with everted rim, short cylindrical neck, conical body and 2 handles under the accentuated shoulder (3I), appears in the MBA¹³⁴. The shape is found in the LBA I at Körösszegapáti-Pál-lapály¹³⁵, Crasna-Csereoldal¹³⁶ and Recea-Valea Sulduba/CEMACON¹³⁷, later at Suplacu de Barcău-Lapiș¹³⁸.

The 3J low bowl, with a horizontally everted rim and arched body is found in the Hajdúbagos-Cehăluț area at Nyíregyháza-Oros-Úr csere¹³⁹ and Recea-Valea Sulduba/CEMACON¹⁴⁰ sites.

The 2A pot has straight rim, elongated ovoidal body, straight base, ornamented with two conical knobs under the rim. It is found at Crasna-Csereoldal¹⁴¹, Doh-La izvoare¹⁴², Pișcolt-Nispărie¹⁴³,

Suplacu de Barcău–Lapiş¹⁴⁴, Recea–Valea Sulduba/CEMACON¹⁴⁵ and Tăşnad–Sere sites, as well as in Piliny¹⁴⁶ assemblages.

Pot shape 2B has straight rim, short, cylindrical neck and spherical body. It is the component of the pottery assemblages at Recea–Valea Sulduba/CEMACON¹⁴⁷ and Şimleu Silvaniei–Observator¹⁴⁸ settlements.

The 3A3 dish with flaring, lobed rimmed and conical, arched body is a popular vessel form in the Late Bronze Age, usually richly decorated with incised horizontal lines and garlands. The shape also has a conical knob on the curved shoulder. The straight base is often ornamented with complex incised or channeled motifs. The type can be considered one of the mainstays of the Tumulus culture¹⁴⁹, although it is very common in north-eastern Hungary and north-western Romania from the RBB1 period to the end of the RBC period. Similar finds occur in the Hajdúbagos–Cehăluț¹⁵⁰, Berkesz¹⁵¹, Egyek¹⁵², Piliny¹⁵³ and Biharea¹⁵⁴ sites, as well as in the ceramic deposit from Debrecen¹⁵⁵. It appears among OFCC¹⁵⁶ and Wietenberg¹⁵⁷ finds, likewise in the Tumulus pottery assemblages from the southern part of the Great Hungarian Plain¹⁵⁸.

The 3B bowl type has flaring rim, short, cylindrical neck, slightly curved shoulders and oblique walls, narrowing towards the base. It was found at the sites of Körösszegapáti–Pál–lapály¹⁵⁹, Nyíregyháza–Tesco¹⁶⁰, Nyíregyháza–Oros–Úr csere¹⁶¹ and Recea–Valea Sulduba/CEMACON¹⁶².

The 5A low mug has flaring rim, conical body, widening at the base. It is known from Recea–Valea Sulduba/CEMACON¹⁶³ site.

Type 2C pot has slightly inverted rim, arched neck and conical body. It has been found in the Hajdúbagos–Cehăluț area at Tăşnad–Sere (Pl. 11/6), Cehei–Nove¹⁶⁴ and Nyíregyháza–Oros–Úr csere¹⁶⁵ sites.

Cup 4A has slightly flaring rim, curved neck, accentuated shoulder, flattened spherical body and a handle raised over the rim. In the Hajdúbagos–Cehăluț area it can be found at Tăşnad–Sere (Pl. 11/1), Doh–La izvoare¹⁶⁶, Nyíregyháza–Oros–Úr csere¹⁶⁷, Hajdúbagos–Daraboshegy¹⁶⁸ and Biharea¹⁶⁹. It is also encountered at Egyek¹⁷⁰ and Piliny¹⁷¹ sites.

Ornamental motifs

The A1 small knob with semi-circular section occurs in Hajdúbagos–Cehluț environment at Acâș–Râtul lui Veres¹⁷², Nyírlugos–Szennyespuszta/Szabadságtelep¹⁷³, Nyíregyháza–Oros–Úr csere¹⁷⁴ and Tăsnad–Sere (Pl. 8/9). It is also encountered on Otomani–Füzesabony pots at Carei–Bobald¹⁷⁵.

Groups of medium and wide horizontal channellings (H1) appear mainly on bowls and amphorae. These are located on the neck and shoulders of the vessels, together with incised zigzag¹⁷⁶ and groups of short, incised vertical¹⁷⁷ and curved lines¹⁷⁸ or knobs surrounded by groups of narrow channellings¹⁷⁹. Horizontal channellings appear mainly on the outer surface of the bowl base. They occur in combination with three circular alveoli¹⁸⁰, incised arcade motif¹⁸¹, narrow semicircular channellings¹⁸² or semicircular channellings and a row of dots surrounding a knob¹⁸³. The horizontal channellings placed above the base of the vessels can be linked to the practice of ornamenting the base, as the two occur together in the majority of cases¹⁸⁴. On pots it appears rarely, met in only one instance in Hajdúbagos–Ceháluž sites, where it is visible on the shoulder and along the maximum diameter of the vessel¹⁸⁵. Horizontal

XVIII/2, XXXIV/2).

¹⁸⁵ Marca–Husău (Bejinariu *et al.* 2014, Pl. 22/1).

channelings are also rare among the decorative elements of the drinking vessels, being applied mainly on the neck, shoulder and above the base¹⁸⁶.

The row of circular impression (F1) is a common ornament in the LBA, as it occurs in Hajdúbagos–Cehăluț¹⁸⁷, Piliny¹⁸⁸, Tápé¹⁸⁹ and Cruceni–Belegiș¹⁹⁰ environment. It is also encountered in the MBA, in the pottery assemblages assigned to the OFCC¹⁹¹.

The pairs of curved, interlocking lines (I1) appear as early as the end of the MBA and continues to be used in the early LBA, mainly on bowls¹⁹². It can also be encountered in Otomani–Füzesabony¹⁹³ pottery assemblages.

Ornamental motif I2, the row of long-stemmed, unevenly placed incised arches and similar diagonal or interlocking variants occur exclusively on various types of bowls, usually placed on the lower part of the body, from the shoulder to the base¹⁹⁴. The decorative element appears in combination with incised horizontal lines or pair of lines¹⁹⁵, groups of vertical, short lines and rows of impressed circles¹⁹⁶. At Pir and Toboliu, the surface between the arches is filled with impressed circles or short lines¹⁹⁷, similar in appearance to the hatched arches. It occurs in the MBA OFCC assemblages as well¹⁹⁸.

The triple lined, long-stemmed arches (I3) are also found on the sides of bowls.¹⁹⁹ Similar, but linked arches are met in LBA I sites²⁰⁰. Usually these ornamental elements are found on the neck and belly of amphorae, in association with incised lines, groups of lines and semicircular channelings²⁰¹.

Ornamental motif I4, the diagonally placed groups of lines on the central vertical line, resembling the shape of a pine tree, is found on indeterminate fragments at Tăşnad–Sere²⁰², and its variants at Nyírlugos–Szennyespuszta²⁰³. It appears in the cemetery of Salka I²⁰⁴, in Cruceni–Belegiș assemblages²⁰⁵ and among Wietenberg²⁰⁶ pottery.

The row of short diagonal incisions (I5) is met on the outer surface of the bowls' rims, mostly on sites dated in the LBA I²⁰⁷.

The hatched arcade motif (L1), most often filled with lines arranged vertically²⁰⁸ or sloping to the right²⁰⁹ and left²¹⁰, is characteristic for the Hajdúbagos–Cehăluț style. The vast majority of the ornamentation adorns the shoulder and the maximum diameter of the bowls. A single occurrence is known on a mug²¹¹. It can already be found in the Otomani–Füzesabony pottery ware²¹².

The decoration of the vessel's base (N1, N2) is a typical practice already encountered at the end of the MBA²¹³, and becomes common in the first two phases of the Late Bronze Age. Base ornaments take a variety of forms, often consisting of concentric channellings, alveoli and semicircular channellings, geometric patterns of hatched bands or complex motifs of incised lines. In the material culture of the Hajdúbagos–Cehăluț pottery style the base of the bowls²¹⁴ are ornamented in the vast majority, and only in the rarest cases the bases of amphorae²¹⁵ or of drinking vessels²¹⁶. This practice can also be traced in the Balta Sărătă II, IIII and IV²¹⁷, Cruceni–Belegiș²¹⁸ assemblages in Banat and other sites assigned to the Tumulus culture²¹⁹.

The incisions made with a broom (D1) are permanent elements of the Bronze Age material culture, in the Hajdúbagos–Cehăluț area being applied mainly on the sides of pots²²⁰, although it is also rarely found on bowls²²¹. It occurs in association with conical knobs²²² or bands with irregular circular incisions²²³. It is a common element of the Suciu de Sus²²⁴ pottery as well.

²²³ Tășnad–Sere (unpublished material).

²²⁴ Someș–Uileac (Pop 2003, Fig. 2/9, 10).

The rows of circular alveoli (F3) appear on the sides of bowls, with a semicircular knob surrounded by narrow channellings²²⁵, together with a semicircular row of circular stiches and groups of narrow channellings²²⁶.

Although the upwardly displayed group of semicircular narrow channellings (H2) usually appear surrounding knobs, they can also be found relatively frequent below the handle of vessels²²⁷, and it is therefore justified to treat them as a separate category. Narrower and wider channellings also appear under the handles of bowls²²⁸.

Among the group of knobs surrounded by semicircular flutes or incised lines, several combinations of ornamental motifs can be distinguished by the thickness and number of flutes and the shape of the knobs. M1²²⁹ and M2²³⁰ ornamental motifs also belong to this group. Both are placed mainly on bowls, on the maximum diameter of the vessel. They are used both in the LBA I and LBA II, thus it is not possible to date them within a narrower time interval.

The I6 incisions displayed in garland pattern occur on the neck and shoulder of amphorae, mainly in the sites of the pottery style dated in the LBA I²³¹.

The C1 impressed rib is characteristic for the LBA pottery, predominantly located under the rim, on the upper part of the neck²³² and on the shoulder²³³. It can also be found at OFCC sites²³⁴.

Only one example of the C2 short rib with irregular impressions is known from Hajdúbagos–Cehăluț sites, on the shoulder of a pot²³⁵. It is met in Cruceni–Belegiș assemblages²³⁶, too.

The H3 group of semicircular narrow flutes displayed downward, occur on both amphorae and bowls²³⁷.

The H4 group of narrow channellings in LBA I and II is most commonly met, surrounding a knob, but can also be observed under the handle of bowls²³⁸. It mainly adorns the bowls²³⁹, sometimes appearing with three circular alveoli²⁴⁰.

Ornamental motif I7, a row of V-shaped pair of incised lines, occurs on bowls, together with a band of oval impressions²⁴¹. It is also rarely seen on the belly of cups or mugs grouped with a pair of lines²⁴². At Tăşnad it appears in features dated in the LBA I, while at Recea occurs between 1410 and 1210 cal BC. The incised band can be met in MBA assemblages as well, assigned to the Wietenberg style²⁴³.

²²⁵ Recea–Valea Sulduba (Bejinariu 2022, Pl. LII/4).

²⁴⁰ Doh–La izvoare (Bejinariu, Lakó, Sana 2004, Pl. X/1).

²⁴¹ Recea–Valea Sulduba (Bejinariu 2022, Pl. XLVII/5).

²⁴² Tăşnad–Sere (Pl. 6/4).

²⁴³ Stolna–Băştioara (Daróczi, Ursuțiu 2015a, Type plate 21/Incised band 19, Plate 210/5211); Daróczi–Ursuțiu 2015b, Pl. 4/Incised band 19; Brașov–Bartolomeu–Schottergrube (Boroffka 1994, Taf. 17/5).

The A2 wide rectangular knob type with curved edges and two impressions is found mainly applied on pots²⁴⁴ both in LBA I and II²⁴⁵.

The oblique rib with oval impressions (C3) occurs only twice in the Hajdúbagos–Cehăluț area, in the settlement of Tășnad (Pl. 11/6), together with long rectangular knobs, with an impression in its central part or rows of left-sloping, grain-shaped impressions. The ornamental motif is met in OFCC assemblages²⁴⁶. It is also found with F4 type²⁴⁷ row of impressions at Tășnad. Right-sloping grain impressions similar to the F4 decoration are much more common in the LBA I, applied on pots²⁴⁸, bowls²⁴⁹ and mugs²⁵⁰.

The F5 horizontal row of circular alveoli is a common ornamental element of the period²⁵¹, displayed on the necks and shoulders of mugs²⁵², on the neck or the belly of bowls²⁵³, on amphorae²⁵⁴, mostly in assemblages dated to the LBA I. It also occurs in the surrounding Tumulus pottery assemblages at Egyek²⁵⁵, Salka I²⁵⁶, Tápé²⁵⁷ and in Cruceni–Belegiș²⁵⁸ features, as well.

The H5 wide, vertical channellings appear on pots²⁵⁹, bowls²⁶⁰ and drinking vessels²⁶¹, met both in the LBA I and LBA II. The decoration appears already in the sites attributed to the MBA OFCC²⁶² and later in Piliny²⁶³ environment.

The group of horizontal incised lines (I8) is a characteristic decoration of the period²⁶⁴. It can be found on the neck and shoulder of mugs²⁶⁵, on the neck of cups²⁶⁶, jugs²⁶⁷, amphorae²⁶⁸ and on bowls²⁶⁹. It can also be encountered in the MBA Otomani–Füzesabony ware²⁷⁰, as well as in the contemporaneous Tumulus pottery assemblages²⁷¹.

Discussion

Based on the total assemblages of finds from all the Hajdúbagos–Ceháluť sites, the decorative elements that can be seen on the pots are the A2 type bosses, the C1, C3 and C2 type ribs and the F4 impressions. The F3 circular impressions, the H2 curved flutes, the I1 interlocking pair of lines, the I3 long semicircular arches, the I4, I5 line motifs and the M2 type knobs surrounded by semicircular channellings at the base, are elements of the ornamentation of the bowls. Similarly, on the bowls can regularly be met the arcades and the ornamentation of the base, which was rarely applied on cups and amphorae. The I6 low arcades appear only on amphorae, while the H3 channelling is almost equally represented in the ornamentation of amphorae and bowls. Vertical and horizontal channellings (H1, H5), semi-spherical knobs (A1) and rows of alveoli (F5, F2) appear on amphorae, bowls, cups and mugs (Fig. 6, Fig. 7, Fig. 8).

The different ornamental elements are usually placed on the same part of the body. While the brooming can cover the entire surface, the C3, H5, H2 and I4 ornaments are usually placed on the

Fig. 6. Chronological distribution of the association of pottery shapes and ornamental motifs.

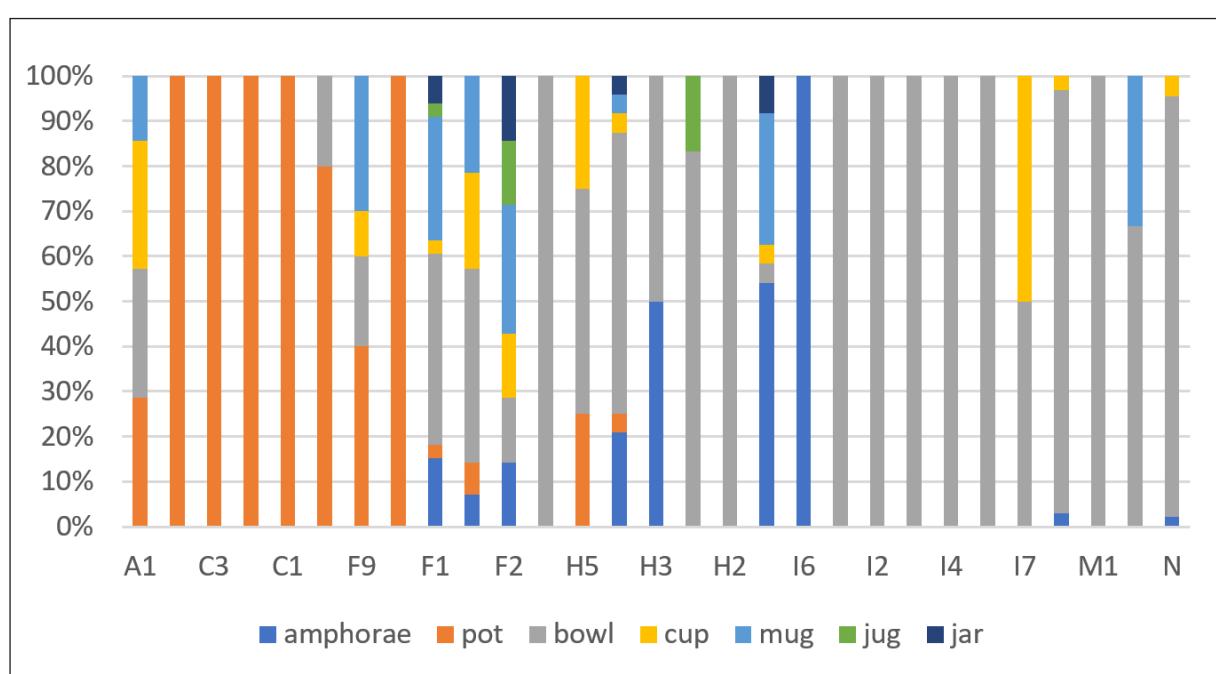

Fig. 7. Distribution of ornamental motifs on the pottery types.

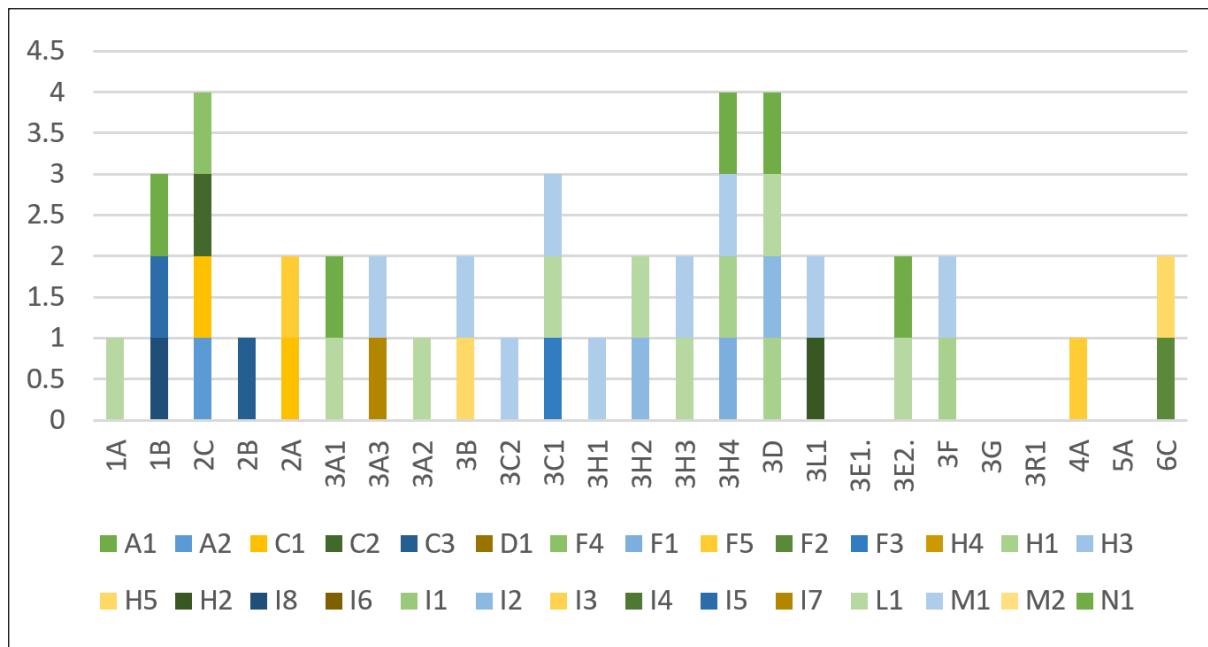

Fig. 8. The presence of ornamental motifs on pottery shapes.

maximum diameter (OP7²⁷²) of the vessel. Likewise, the C2 rib appears on the shoulder (OP6), while the F3, I3 appear only on the lower part, below the belly line (OP8). I5 motif decorates the top of the rim (OP2), and F4 impression appears just below the rim (OP3). There is more variation in the ensembles of knobs and channelling (M1, M2), as they are placed below the rim (OP3), on the neck (OP6), on the maximum diameter (OP7) and below the belly line (OP8) (Fig. 9).

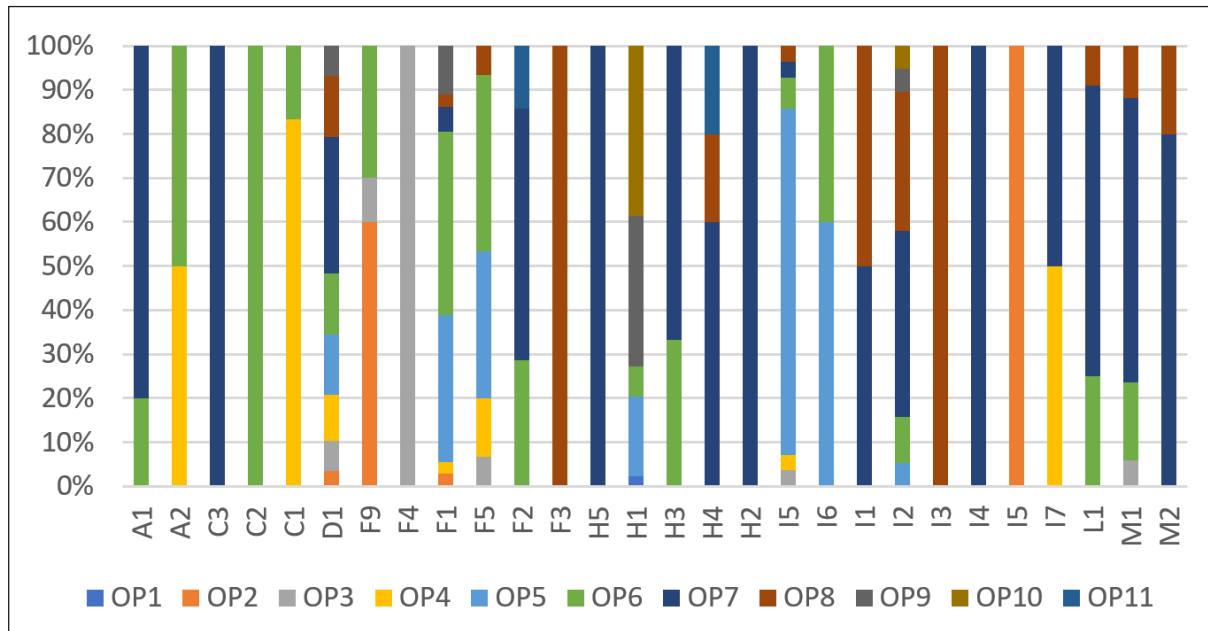

Fig. 9. The position of the ornamental motifs on the ceramic body.

²⁷² For the data collection I followed the methodology developed by T. Daróczki, according to which 12 position can be distinguished on the vessel's body. These can be interpreted primarily as intervals and not as defined points. Positions 1, 2, and 3 are located on the inner surface of the rim, on the top of the rim, and immediately below it. The top of the neck is represented by number 4 and the middle part by number 5. The shoulder decorations are number 6. The position of the decorations on the maximum diameter of the body is coded with nr. 7. The upper half of the surface between the maximum diameter and the base is marked with nr. 8, while the middle half is nr. 9. Position 10 represents the outer surface of the base, position 11 marks the handle and position 12 the ornamentation of the base. (Daróczki, Ursuțiu 2015a, 307, Type plate 31; Daróczki, Ursuțiu 2015b, 3, Fig. 3).

Based on a combined analysis of the ^{14}C data, the dated pottery assemblages' stylistic characteristics and its analogies, some comments on the chronology of ceramic use can be made. In accordance with the relative chronology, the ^{14}C data suggest the placement of the 1A, 3A2, 3H2, 3H3, 3H4, 3E2 pottery shapes and H1, I2, I3, I5, F3, H2 and I6 ornamental motifs in the LBA I. In the LBA II period occurs 3B, 5A, 2C shapes and the C2 type short rib. More common elements of the material culture can be considered pottery shapes 3A1, 3D, 3F, 3G, 3C1, 3C2, 3H1, 3I, 3J and 6A, also decorative elements A1, F1, I4, N1, N2, D1, M1, M2, which are dated with absolute data in the LBA I, still occur in later sites, as well. The same applies to 2A, 2B, 3A3 shapes and A2, C1, C3, H3, H4, H5, I7, I8 ornamental motifs, which are dated with radiocarbon data in the LBA II, but they occur in the sites assigned to the LBA I, too.

Conclusions

The limited available radiocarbon data does not allow to draw any firm conclusions, nor to elaborate a typochronological system for the LBA I-II pottery in north-western Transylvania.

The ^{14}C data both from Tăşnad and from Recea confirm, that the stylistic elements popular in the LBA I and II in north-western Romania already appear in the BB1/B2 period, in the 16. c. BC, as noted in previous literature²⁷³.

The pottery of the so called Hajdúbagos–Cehăluț style is the result of the hybridisation of the OFCC and the Tumulus pottery, as a significant proportion of MBA forms and decorative elements remain in use at the beginning of the LBA, alongside a few previously unknown forms but a large number of ornamental motifs.

During the LBA, the pottery of the Tumulus communities in the Great Hungarian Plain shares many elements and exhibits a high degree of similarity. Most of the elements of the Hajdúbagos–Cehăluț pottery are also part of the ceramic assemblages of the surrounding areas. No distinctive identity markers can be identified, the authentic elements being the hatched arcades and perhaps the 3A1 bowl type. Fluidity and constant change characterise the ceramic style of the period. In the periphery of the distribution area, Wietenberg and Noua style elements can be observed, along with common decorative motifs are also common, especially in the former Egyek and Piliny area. In LBA II, pre-Gáva features emerge as precursors to the uniformization process that would lead to the Gáva cultural complex. Recent research in Banat and in Central Transylvania is unanimous in the view that the relative chronology based on pottery requires reinterpretation²⁷⁴. A similar conclusion applies to the Hajdúbagos–Cehăluț ceramic material. The temporal variation in the appearance of forms and decorations may also reflect the adherence of different communities to their traditions or their openness to new technologies and innovation, as each community adopts new cultural and economic trends at different rates.

In the first two phases of the Late Bronze Age, the lower basins of the Criș/Körös, Barcău/Berettyó, Ier and Crasna Rivers exhibit a mixed character in pottery material, featuring Middle Bronze Age elements alongside typical Tumulus pottery from the Tisza region and Banat. This area can be seen as a melting pot of diverse influences from the east, south, west and north. We observe a mixed material culture in which identity markers are not clearly defined, allowing for interpretation only in relation to the period before and after.

Acknowledgments

I would like to express my gratitude to Zsolt Molnár and Liviu Marta for the radiocarbon analysis, also to Cristian Virág and Liviu Marta for the kind permission to process the find material from Tăşnad–Sere.
